AAC7446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatoriopic; vulnerary; antiparkinsonian; nootropic; neuroprotective; costeopathic; antiparkinsonian; nootropic; neuroprotective; costeopathic; antiparkinsonian; nootropic; neuroprotective; costeopathic; antiparkinsonian; immunosuppressant; immunosimulant; cardiant; thrombolytic; coapulant; vasotropic; antidiabetic; hypotensive; dermatchological; immunosuppressive; antidiabetic; hypotensive; dermatchological; immunosuppressive; antidiabetic; hypotensive; dermatchological; immunosuppressive; antithyroid; and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis; graft vs host disease, cardiovascular disease, diabetes mellitus, hypothyroidism, cholesterol ester storage, systemic lupus crythematosus, severe combined immunodeficiency (SCID), AIDS, viral, allergies, aplastic anneania, burns, wounds, bone and cartilage damage, competurial not fungal infection, malarial autonic mocturial or fungal infection, malarial autonic mocture and and cartilage damage, competure and and cartilage damage, competure and cartilage and cartilage and cartilage and cartilage and cartilag

proteins, called parcreatic cancer antigens, given in AAB54008 to
AAB5466. The human pancreatic cancer antigens have cytostatic.
CAAB5466. The human pancreatic cancer antigens, and can be used in gene therapy. The polynucleotide and proteins can be used for preventing, treating, or ameliorating a medical condition or in assays for diagnosing a pathological condition or a susceptibility to one in a subject. Binding partners to the proteins and the activity of the proteins can be identified. The pancreatic anscer antigens can be used to detect, treat or prevent pancreatic disorders, especially cancer.
CAAD015ts and antagonists to the antigens can be used to design nucleic acid hybridisation probes that can be used in chromosome mapping, linkage and hybridisation probes that can be used to generate antibodies and diagnostic methods. The proteins can be used to generate antibodies which are used to purify, detect and target the polypeptides, including both in vivo and in vitro diagnostic and therapeutic methods. The proteins can be used to generate antibodies both in vivo and in vitro diagnostic and therapeutic methods. The proteins cancer neutral, immune system, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal or proliferative disorders. AAC99222 to AAC99240 and AA

ophthalmological, nephrotropic, cytostatic, hepatotropic, antiarteriosclerotic, antiarthritic, antirheumatic activity and can be used for gene therapy. The nucleic acid sequences may find use as tools to identify agents against anglogenic diseases. The polypeptides may be used in medicaments for gene therapy to treat anglogenic diseases. (I) in sense or antisense form may be used. The genomic genes may also be used with suitable promoters and/or enhancers. The sequences (nucleic acid and proteins) may be used to treat psoriasis, arthritis, especially theumatoid arthritis, haemangloma, majofibroma, eye diseases, especially diabetic retinopathy, neovascular glaucoma, kidney disease, such as glomerulonephritis, diabetic nephropathy, malign nephrosclerosis, thrombotic microangipathic syndrome, transplantation rejection and plomerulopathy, fibrotic disease, such as liver cirrhosis, mesangial cell proliferative disease, arteriosclerosis and injury to nerve tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                 7866

This invention describes novel nucleic acid sequence (I) obtained from an endothelial cell comprising any of 59 sequences (defined and given in the specification), its allelic variant, or complement. The products of the invention have anti-angiogenic, angiogenic, antipsoriatic, anti-arthritic, antifibrotic, antiarteriosclerotic, nephrotropic, antidiabetic, ophthalmological, hepatotropic, immunosuppressive and neuroprotective activity. (I) are implicated in differentiation and proliferation of endothelial cells. (I) are used for expression of polypeptides (IV) that are useful for identifying agents (A) for treatment of angiogenic disease, to express (IV) from gene therapy vectors for treatment of such diseases and as antisense reagents. (IV) are also used to raise specific antibodies. Angiogenic diseases that may be treated include psoriasis, arthritis, hemangioma, diabetic retinopathy, glomerulonephitis, transplant rejection, liver cirrhosis, arteriosclerosis and injuries to nervous tissue. AAA98102-A98161 represent proliferation-associated and differentiation-associated EST (expressed sequence tag) derived sequences which are described in the method of the invention.
Nucleic acid sequences from human endothelial cells, useful for getherapy of anglogenesis and for identifying antianglogenic agents
                                                                                                                                                                                  Claim la; Page 95; 115pp; German.

The present sequence is one of 3351 sequences in a library of human polynucleotides. The library is used to detect differentially expressed dense correlated with a cancerous state of a mammalian cell and can detect colon, prostate, breast and lung cancer. The library can be used to produce probes for detection of mRNA and to produce additional copies of the polynucleotides. The probes can be used for chromosome mapping of the polynucleotide and for detection of transcription levels. Ribozymes or antisense oligonucleotides can be generated. The polynucleotides and their gene products are used as genetic or biochemical markers (e.g. in blood or tissues) that will detect the earliest changes along the carcinogenesis pathway and/or monitor the efficacy of therapies and preventive interventions. The polynucleotides, polypeptides and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Innis MA, Garcia PD, Klinger J, Kassam A;

Introduction to represent polynuticollines, the present invention also describes a method of detecting differentially expressed genes correlated with a cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample derived from a cell suspected of being cancerous, where detection of the differentially expressed gene product is correlated with a cancerous state of the cell from which the test sample was derived. The polynucleotides sequences can be used in a method for detecting and expressed genes correlated with a cancerous state of a mammalian cell. The polynucleotides correlated with a cancerous state of a mammalian cell. The polynucleotides can also be used as probes for detecting and mapping related genes. They can be used in diagnosis and prognosis of diseases and disorders (e.g. identification of cancer, or responsiveness of cancer to therapy). This is particularly for breast cancer, oestrogen receptor-positive breast cancer, oestrogen receptor-

The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intext 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design
                                                                                                                                                                                                                                                                                                                                                                                          5' EST; expressed sequence tag; secreted protein; cDNA isolation; nerapy; chromosome mapping; ss.

                                                                                                                       1740 gccgcatcacccgctcaatggctaatgaggccaacagcgaggaggccatcacccccagc 1799
A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 787 "GS" sequences given in AAT1901-T25837 and which is able to hybridse to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of CDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-untranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Identifying gene signatures in 3'-directed human cDNA library - e.g. for diagnosis of abnormal cell function, by preparing cDNA that reflects relative abundance of corresp. mRNA in specific human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gene signature; messenger RNA; mRNA; relative abundance; frequency; human; cloning; mapping; non-biased library; diagnosis; detection; cell typing; abnormal cell function; ss.

```
cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample from a cell suspected of being cancerous, where the gene product is encoded by one of the 5248 polynucleotide sequences given in AAZ12532 to AAZ17779. The polynucleotides can be used as a source of primers and probes, which can be used for a variety of purpose, e.g. detection of expression levels, mapping, tissue typing or profiling, forensics, genetic analysis and detection of polymorphisms. Polypeptides encoded by the polynucleotides can be used for raising antibodies for experimental, diagnostic and therapeutic purposes. The polynucleotides may also be used to construct arrays for diagnostics (which may be used to determine function of an encoded protein); and to detect differences in expression levels between two cells (e.g. to identify abnormal or diseased tissue in a human, to identify a genetic predisposition or susceptibility to a disease such as cancer). The polynucleotides of the invention are especially used in the diagnosis, prognosis and management of colorectal cancer, breast cancer, and in a concern for contains and analyses of the invention are specially exect to contain and analyses of the diagnosis, broancer, breast cancer, and lung cancer. The polynucleotides can also be used to screen for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 789 BP; 282 A; 151 C; 175 G; 162 T; 19 other;

AAA00010 to AAA02716 represent polynucleotides isolated from CDNA libraries constructed from human colon cancer cell lines. The present libraries describes a method of detecting differentially expressed genes correlated with a cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample derived from a cell suspected of being cancerous, where detection of the differentially expressed gene product is correlated with a cancerous state of the cell from which the test sample was derived. The polynucleotides sequences can be used in a method for detecting mammalian cell. The polynucleotides can also be used as probes for detecting and mapping related genes. They can be used in diagnosis and prognosis of diseases and disorders (e.g. identification of J, Innis MA, Garcia PD, Sudduth-Klinger J; Randazzo F, Kennedy GC, Pot D, Kassam A; Crkvenjakov R, Dickson M, Drmanac S, Labat I; Garcia V, Jones LW, Stache-Crain B; Polynucleotide library used to determine cancerous states of mammalian progress of the progress of th iveness of cancer to therapy). This is particularly for breast oestrogen receptor-positive breast cancer, oestrogen receptor negative breast cancer, lung cancer, and colon cancer. The present sequence is one of 3351 sequences in a library of human polynucleotides. The library is used to detect differentially expressed genes correlated with a cancerous state of a mammalian cell and can detect colon, prostate, breast and lung cancer. The library can be used correlated probes for detection of mRNA and to produce probes for detection of mRNA and to produce additional copies of the polynucleotides. The probes can be used for chromosome mapping of the polynucleotide and for detection of transcription levels. Ribozymes the polynucleotide and for detection of transcription levels Ribozymes their gene products are used as genetic or biochemical markers (e.g. in blood or tissues) that will detect the earliest changes along the carcinogenesis pathway and/or monitor the efficacy of therapies and antibodies against them can be used in pharmaceutical compositions to treat the cancers and be used in pharmaceutical compositions to the acceptance of the proposition of the proposi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           pulmonary hypertension; pulmonary vasoconstriction; emphysema; chronic obstructive pulmonary disease; leukemia; lymphoma; carcinoma; colon cancer; breast cancer; lung cancer; pancreatic cancer; hepatocellular carcinoma; kidney cancer; melanoma; hepatic metastasis;

Initiation against at read and the juxta-section between codding and non-codding regions of RNAs corresponding to target genes, gene initiation codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'-end and the juxta-section between codding and non-codding regions and all segments of RNAs encoding proteins associated with one corresponding for ageneres AAX55272-74. These multiple target of general from sequences AAX5527-74. These multiple target oligonucleotides (specifically AAX5180-271) can be used for the antisense treatment of diseases and conditions. Typical diseases and conditions are those associated with impaired respiration and inflammation, allergic rhinitis, acute asthma, allergies, asthma, impeded inflammation, allergic rhinitis, acute asthma, allergies, asthma, impeded conditation, respiration pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary disease (GoPD), and cancers such as leukemias, tymphomas, carcinomas e.g. colon cancer, breast cancer, melanoma, pancreatic cancer, hepatocellular carcinoma, kidney cancer, melanoma, hepatic metastasized to the lungs, including breast and prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The specification describes antisense oligonucleotides (AAX52869-X55271) directed against at least 2 mRNAs selected from target genes, coding and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          111316 GCTGGCCACCGCCCCCAAGTGGAGTGGCTGGGCGGGCCCACVCVVAACGGGACCG 111257

               /note="Organ: lung; Vector: pT7T3D-pac (Pharmacia) with a modified polylinker; lst strand cNRA was prepared from pooled lung tumor tissue, and was then primed with a Not I oligo(dT) primer. Double-stranded cDNA was ligated to ECO RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and ECO RI sites of the modified pT7T3 vector. Library went through one round of normalization. Library constructed by Bento Soares and M. Patima Bonaldo.
